

AAF Expands Replacement Dust Collector Cartridge Filter Product Line

LOUISVILLE, KY – August 2002 – AAF International now offers a complete line of replacement cartridge filters to fit most models of pulsejet dust collection equipment. Engineered to operate in harsh industrial environments, these retrofit filters are designed to fit dust collectors manufactured by Donaldson Company, Camfil Farr, United Air Specialists, Pneumafil, and Mac Equipment to name just a few.

Scientifically developed to collect submicron dust particles, the superb blend of synthetic fibers and special hydrophobic resin prevents absorption of moisture while maintaining a low-pressure drop, high dust holding capacity, and excellent airflow. Consistent, long-lasting performance is guaranteed throughout the life of the filter.

Built to exacting specifications, AAF replacement cartridge filters are engineered to ensure media pack integrity and maximum surface area. Galvanized steel end caps are bonded to the media to form a solid assembly. Pleat lock stabilization ensures uniform spacing between the pleats and superior dust release during pulsing. Manufactured to ISO 9001 quality standards, each filter component was selected based on providing outstanding performance and value.

Efficient on a wide range of dust problems found in the automotive, aerospace, industrial machinery, and metalworking industries, AAF retrofit filters provide an economical solution for many existing dust collection systems. For problem applications, AAF cartridge filters are available in a wide variety of media and backed by the technical expertise of AAF engineers.

All AAF replacement cartridge filters are guaranteed to meet rated performance standards based on industry accepted test procedures. AAF replacement filters provide 99.999% average efficiency on submicron particles with low energy and operating cost.
